A guide from JBS Praxis

The Praxis Method

How we take one area of your organisation from how it runs today to a system that answers for it.

Why the method exists

Every organisation runs twice: once on paper, and once in practice.

In this guide

The method at a glance	3
1. See	4
2. Design	5
3. Build	6
4. Hold	7
Ownership	8
Security and data	9
How it starts	10

Formerly the Praxis Framework.

Every organisation has two versions of itself. One is on paper: the policies, the organisation chart, the budget, the process map. The other is how the work really gets done.

In the second version, numbers are rebuilt by hand at month end, approvals wait for one person, and decisions are made without the facts. Email sits in one place, chat in another, accounts in a third, approvals somewhere in between. Each tool answers for itself; none answers for the organisation. The distance between the two versions is where money leaks, people tire and boards lose confidence.

Order, made visible

Praxis means theory put into practice. JBS Praxis does two things. First we make the order: we design how money, people, operations and risk should flow. Then we make it visible: we build the system that shows, every day, whether they do. Consulting makes the order; engineering makes it visible.

One method for every engagement

The Praxis Method is how we do both. It has four stages, See, Design, Build and Hold, and it works on one area of your organisation at a time. Each stage ends with something you can read, check or use, and the same team stays with you from the first meeting to handover.

The result is an organisation that can answer for itself: a straight answer to every question about your money, people, operations and risk, from a system your own team can run.

The method at a glance

Four stages, one area at a time, one team from start to finish.

Each stage builds on the one before. This is the whole method on one page; the next four pages take each stage in turn.

Stage	What happens	What you receive	Who decides
1 See	We sit with the people who do the work and map how one area really runs: who does what, where the numbers live, where time and money leak.	A clear picture and the free audit report.	You choose the area we look at first.
2 Design	We design how it should run: the process, the controls, who approves what, and the few numbers that matter.	A design you can read and sign off.	You sign off the design.
3 Build	We build and configure the system around that design, connect the tools you keep, and move your data across.	A working system, tested with your team.	Your team tests the system with us.
4 Hold	We stay until it holds: we train your people, watch the first cycles, fix what the real world reveals, then hand over the keys.	A system your team runs, and the code and data that are yours.	Your team takes over once the system holds.

What you can expect

- ✓ You own the code and the data.
- ✓ No per-user licences.
- ✓ English and French from day one.
- ✓ One team from first meeting to handover.

1

Stage 1 of 4

See

We start from how the work really gets done.

Before the audit

Estimate what poor quality costs your organisation each year: manual checking, errors fixed internally, and errors that reach your customers or the people you serve.

jbspraxis.com/cost-calculator

We sit with the people who do the work and map how one area of your organisation really runs: who does what, where the numbers live, where time and money leak.

It starts with the free audit and demo. In about an hour, we look at one area of your organisation with you and show you what a straight answer looks like. You leave with a clear picture of how it runs today and what to fix first.

What we look at

- Who does what, who approves what, and where work waits for one person.
- Where the numbers live: the systems, the spreadsheets and the inboxes.
- Where figures are re-keyed, checked by hand or reconciled at month end.
- What rework, delays, errors and double entry cost you.

Every finding comes with its source and the reasoning behind it, so you can check it for yourself.

After See

You receive

A clear picture of how the area runs today, and the free audit report.

Who decides

You choose the area we look at first. With the report in hand, you decide what comes next.

Stage 2 of 4

2 Design

We agree how it should run before anything is built.

The way of working first, the system second.

That is the order of every engagement.

We design how the area should run: the process, the controls, who approves what, and the few numbers that matter.

The design is about how your organisation works, not about software. It sets out the work so that the people who do it, and the people who answer for it, can read it, question it and sign it off.

What the design covers

- **The process.** Each step in order, who does it, and what it needs.
- **The controls.** Checks built into the work rather than added after, including separation of duties: the person who prepares a payment cannot approve it.
- **The roles.** Who can view, create, edit, approve or export, so people see what their job needs and nothing more.
- **The numbers that matter.** The few figures leaders need, and where each one comes from.
- **The terrain.** IFRS and OHADA, naira and CFA francs, English and French, and the way your organisation really works.

After Design

You receive

A design you can read and sign off.

Who decides

You do. You sign off the design, and the build follows it.

Stage 3 of 4

3 Build

We build the system around your design, connected to the tools you keep.

Forecasts and financial models

Cash and revenue forecasts, budgets and scenario models are part of the Money work. We built them for a client whose work stays confidential. A demo is available on request.

We build and configure the system around that design, connect the tools you keep, and move your data across.

The system runs the area and shows how it is running, so a question about it gets a straight answer from your own data.

What we build

- **Money.** Invoicing, payments, ledger, reporting, forecasts and financial models, in your currencies, under IFRS and OHADA.
- **People.** Payroll, time, leave and approvals, with the right person seeing the right figures.
- **Operations.** Projects, stock, deliveries and field teams, tracked as they happen.
- **Risk and governance.** Every action permissioned and logged, with controls built into the work.
- **Data and AI.** Praxis AI answers questions from your own data, cites its sources and opens the next step.

After Build

You receive

A working system, tested with your team.

Who decides

Your team. The system is tested with the people who will run it.

Stage 4 of 4

4 Hold

We stay until the system holds, then hand over the keys.

We run on it ourselves

Our own invoicing, payroll, projects and approvals run on the same system we build for clients.

A system is finished when your own team runs it. So we stay: we train your people, watch the first cycles, fix what the real world reveals, then hand over the keys.

What holding means

- **Training.** Your people learn to run the system on their own work, in English or French.
- **The first cycles.** We watch the system through its first real cycles, such as a month end or a payroll run, and fix what they reveal.
- **Handover.** The keys pass to your team, with the code and the data that are yours.

How the system keeps running

After handover, your team runs the system. Every action stays permissioned by role and recorded in an audit log, so it is always clear who changed what, and when. If you want us to stay on, ongoing support and maintenance can continue after handover.

After Hold	You receive	Who decides
	A system your team runs, and the code and data that are yours.	Your team takes over once the system holds.

Ownership

You own the code and the data, and no licence ties you to us.

We do not sell software licences. We design how an area of your organisation should work, build the system that runs it, then hand it over. What we build for you is yours.

Who you work with	What they leave behind
A strategy firm	A deck.
A software vendor	A licence and a dependency.
JBS Praxis	A system your team runs, with the code and the data that are yours.

Yours to keep

The code and the data belong to your organisation. When we hand over the keys, they stay with you.

No per-user licences

You give access by role, to the people whose work needs it, without counting licences.

In confidence

Client data stays the client's. We never use it for anyone else's commercial purposes, and we name a client only with its approval.

One team, in two languages

Consulting and engineering sit in one team, which stays with you from the first meeting to handover. Everything we build works in English and French from day one.

Security and data

Your data stays yours, and every sensitive action leaves a record.

The systems we build protect what matters by design: who can see it, who can change it, and a record of everything.

Roles and permissions

Every screen and action is allowed by role (view, create, edit, approve or export), so people see what their job needs and nothing more.

A record of everything

Sensitive actions are written to an audit log: who did what, when and from where.

Separation of duties

The person who prepares a payment or a payroll run cannot approve it. Controls are built into the work, not added after.

Private by default

Documents, CVs, receipts and payment proofs are stored privately and only opened through signed, permissioned links.

Aligned with ISO 27001

Our processes follow ISO 27001 practices. We do not claim a certification we do not hold.

Your rights

We work under Nigeria's Data Protection Act (NDPA) and Cameroon's data protection law. You can ask what we hold about you, correct it or have it deleted.

Questions about your data? Write to info@jbspraxis.com. The full page is at jbspraxis.com/security.

How it starts

It starts with a free audit and demo: about an hour, on one area.

See it first

The 3–minute demo on jbspraxis.com shows a chief operating officer asking her company questions and getting answers from its own data. The company in the demo is fictional.

1 Choose a time

Book at jbspraxis.com/schedule. Choose a day, then a time: times are in West Africa Time (WAT), the time in Lagos and Douala. Tell us which area you would like to focus on.

2 We confirm

Our team confirms the meeting by email and sends you the link to join.

3 The audit and demo

In about an hour, we look at one area of your organisation and show you what a straight answer looks like. You leave with a clear picture of how it runs today and what to fix first.

4 If you go further

The work follows the four stages in this guide, See, Design, Build and Hold, with the same team from start to finish.

Built with institutions across Nigeria and Cameroon

- Smart Logistics and Services (Praxis LS)
- MyCity App
- Pixie Girl Global
- Orika Living
- A leading pharmaceutical manufacturer, with Tales Consulting
- An FMCG distributor in Cameroon
- nfelia, our own product

The next step

See it on your own operations.

The free audit and demo takes about an hour. We look at one area of your organisation and show you what a straight answer looks like.
